#### FAB FIND

Computer or clutch? Exploiting E-paper technology, Fujitsu's Fab PC laptop concept creases into the slenderest of bundles. Unfold once to use the keyboard and screen as a personal computer or unfold it completely to enlarge the screen for presentations. [fujitsu.com](http://fujitsu.com)

#### SEE BOB SWIM

With the Seabob, you can skim along the surface of the water or arc through it like a dolphin. Using technology developed by the space industry, Seabob's five-horsepower, electric jetstream system is emissions-free, nearly silent and low-cost, sucking water in and chucking it out under high pressure to generate thrust. [seabob.com](http://seabob.com)

#### LIVE-WORK SPACE

Designed by Stephen Ransom of Architecture+Vision and aerospace consulting firm G-Engineering, the Mars Rover One is the Airstream of extra-planetary explorers. The interior accommodates living and work spaces for three astronauts, as well as a mobile laboratory. And remember, there's no gas station on the Red Planet; the electric motor can withstand 20-day excursions without recharging. If only our earthbound rides were as eco-friendly. #### WORK WITH ME

Not that we want to encourage workaholics but this is actually good for your body. Not only does the Casco laptop concept by Humanscale Design Studio transform into its own desktop (the physical kind), but you can configure the leather-and-titanium carrying case into a variety of positions because it features a separable ergonomic keyboard.
